

ABSTRACT OF THE DISCLOSURE

A network sales system with a settling server and a seller server connected by a network open to third parties, is disclosed. A user terminal and the seller server are

5 connected to each other by a first network, and the settling server and the seller server are connected to each other by a second network. The second network is not accessible from general user terminals. Important personal information such as a credit number of the user is transmitted and received over

10 only the second network, and the settling server is connected only to the second network. Therefore, the credit information is prevented from being stolen by third parties, and

unauthorized third parties are prevented from entering settling server. The network sales system thus has increased

15 security.
